Application Building

Creating Our Flask Application And Loading Our Model By Using Load_model Method

Creating our flask application and loading our model by using the load_model method

```
app = Flask(_name__,template_folder="templates") # initializing a flask app
12 # Loading the model
13 model=load_model('nutrition.h5')
14 print("Loaded model from disk")
16 @app.route('/')# route to display the home page
17 def home():
18 return render_template('home.html')#rendering the home page
20 @app.route('/image1',methods=['GET','POST'])# routes to the index html
21 def image1():
22 return render_template("image.html")
24 @app.route('/predict',methods=['GET', 'POST'])# route to show the predictions in a web UI
25 def launch():
       if request.method=='POST':
         f=request.files['file'] #requesting the file
basepath=os.path.dirname('_file_')#storing the file directory
27
28
            filepath=os.path.join(basepath,"uploads",f.filename)#storing the file in uploads folder
29
               f.save(filepath)#saving the file
30
32
              img=image.load_img(filepath,target_size=(64,64)) #load and reshaping the image
33
34
               x=image.img_to_array(img)#converting image to an array
35
                x=np.expand dims(x,axis=0)#changing the dimensions of the image
```
